RESOURCE AND DEVELOPMENT

MODULE - 12

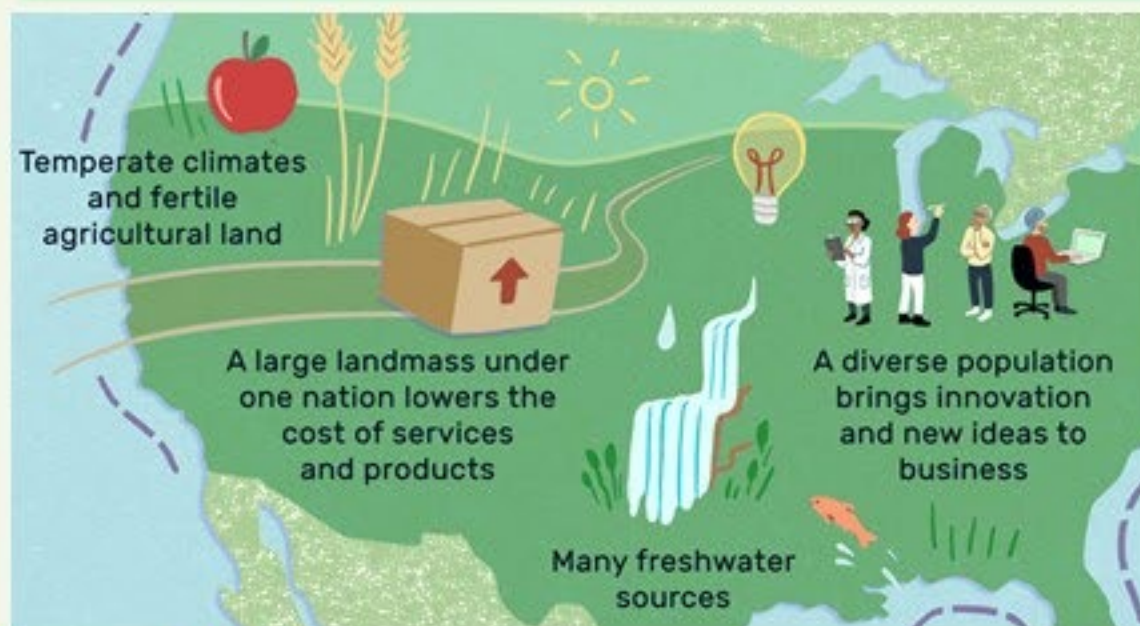

WHAT IS A RESOURCE?

Utility means property of substance which makes it a Resource.

- Everything available in our environment which can be used to satisfy our needs, provided, it is technologically accessible, economically feasible and culturally acceptable can be termed as 'Resource'.
- Natural materials become resources when humans value them.

CLASSIFICATION OF RESOURCES

WHY SHOULD WE DEVELOP RESOURCES?

- It was believed that resources are free gifts of nature.
- As a result, human beings used them indiscriminately and this has led to the following major problems.

Depletion of resources for satisfying the greed of a few individuals.

Accumulation of resources in few hands, which, in turn, divided the society into two segments i.e. haves and have nots.

Indiscriminate exploitation of resources has led to global ecological crises such as, global warming, ozone layer depletion, environmental pollution and land degradation.

WHY SHOULD WE DEVELOP RESOURCES?

- ✓ It has importance in a country like India, which has enormous diversity in the availability of resources.
- ✓ There are some regions which can be considered self sufficient in terms of the availability of resources and there are some regions which have acute shortage of some vital resources.

Importance of resource planning

Maximize project
budget spending

Enhance resource
reporting and forecast

Detailed budget
analysis

WHY SHOULD WE DEVELOP RESOURCES?

- ✓ States of Jharkhand, Chhattisgarh and Madhya Pradesh are rich in minerals and coal deposits.
- ✓ Arunachal Pradesh has abundance of water resources but lacks in infrastructural development.
- ✓ The cold desert of Ladakh is relatively isolated from the rest of the country. It has very rich cultural heritage but it is deficient in water, infrastructure and some vital minerals.

Resource planning involves:

- (i) Identification and inventory of resources across the regions of the country.
- (ii) Evolving a planning structure endowed with appropriate technology, skill and institutional set up for implementing resource development plans.
- (iii) Matching the resource development plans with overall national development plans.

How to create your resource plan ?

List the resources

Estimate how
many resources

Construct a
resource schedule

RESOURCE PLANNING IN INDIA

- The availability of resources is a necessary condition for the development of any region.
- Mere availability of resources in the absence of corresponding changes in technology and institutions may hinder development.
- In India, development, in general, and resource development in particular does not only involve the availability of resources, but also the technology, quality of human resources and the historical experiences of the people.

Resource planning techniques

Resource allocation

Resource levelling

Resource forecast

HUMAN RESOURCE

- ✓ **Population** refers to the whole number of people living in a country or region.
- ✓ Scientific study of human population – **Demography**.

HUMAN RESOURCE: It is the size of population of a country along with its efficiency, educational qualities, productivity, organisational abilities and farsightedness.
It is the ultimate resource, but not equally distributed over the world.

- Some places have sparse population and some dense population.
- Sparsely populated places tend to be difficult places to live.

POPULATION DENSITY

- Density is defined as number of persons in per unit area.
 - ✓ The highest densities are found in North-Eastern USA, North-West Europe, South Asia, South-East Asia and East Asia.
 - ✓ The lowest densities are found in hot and cold deserts, areas around pole, high rainfall area near equator.

DEMOGRAPHIC VARIABLES

Birth Rate: Number of live births per 1000 population in a given year.

Death Rate: Number of deaths per 1000 population in a given year.

Infant Mortality Rate: The number of deaths of infants under 1000 live births in a year.

Maternal Mortality Rate: The number of women who die result of pregnancy and child birth complications per 100000 live births in a year.

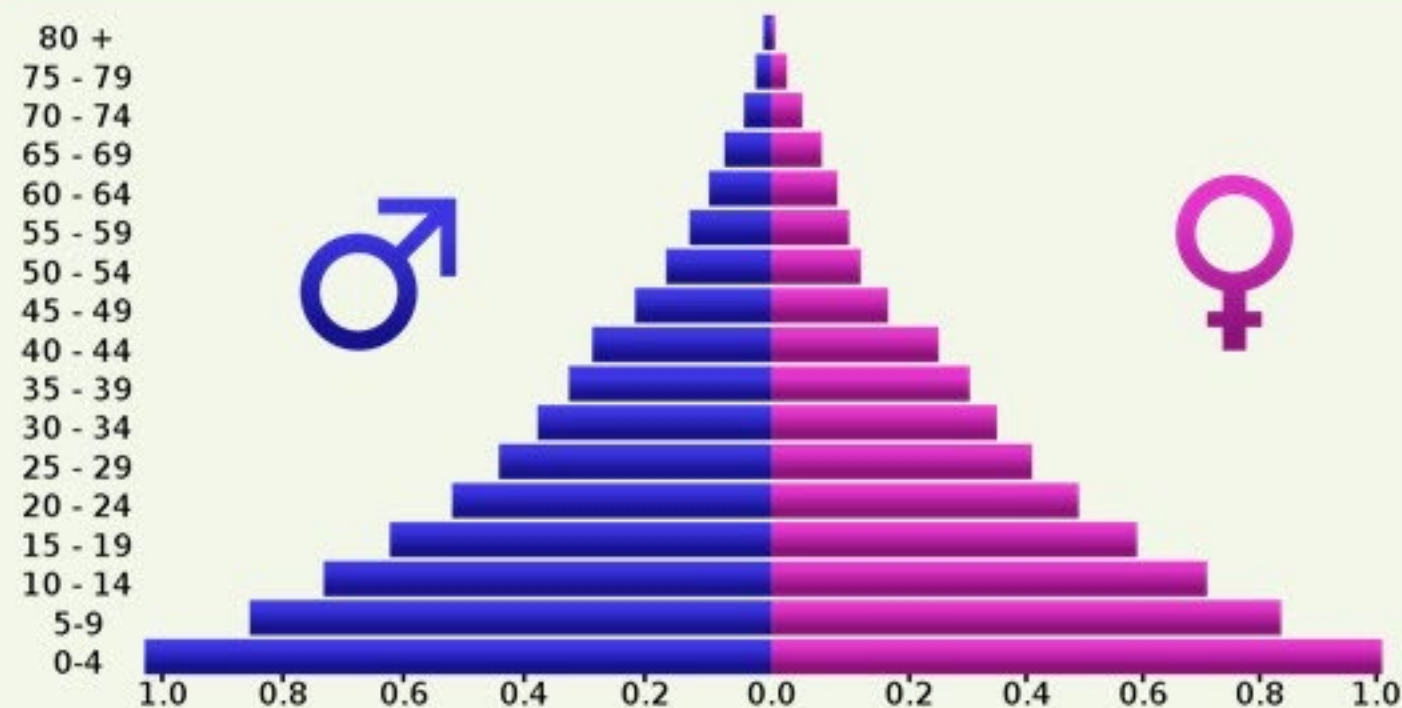

Total Fertility Rate: The average number of children that would be born alive to a women.

DEMOGRAPHIC VARIABLES

Population Pyramid: It is a graph that shows the distribution of ages across a population divided down the center between male and female members of the population.

DEMOGRAPHIC VARIABLES

Doubling Time: The number of years required for the population of an area to double itself, at current rate of population growth.

Age-Dependency Ratio: The ratio of persons in the ages defined as dependent (under 15 years and over 64 years) to persons in the ages defined as economically productive (15-64 years).

Demographic Transition: It refers to shift of birth and death from high to low levels. The decline in fertility is always delayed leading to population growth.

HUMAN DEVELOPMENT

- Development means qualitative change, which is always value positive.
- The concept of human development was introduced by Dr Mahbub-ul-Haq.

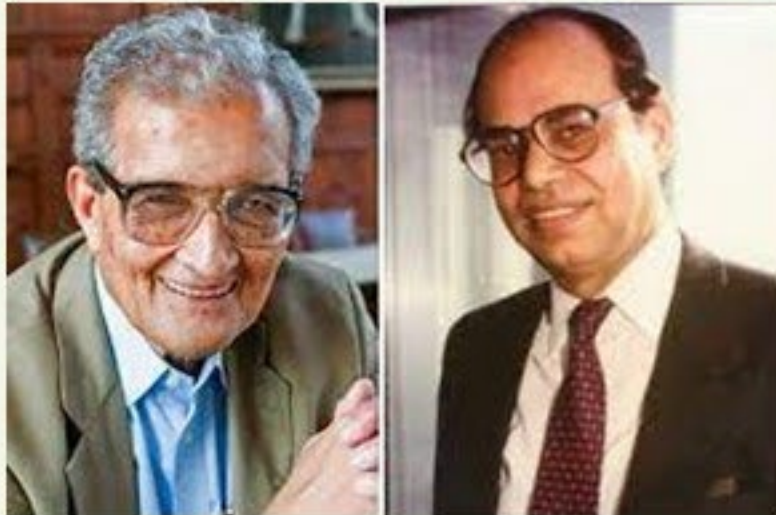

- ✓ Dr Haq has described human development as that development that enlarges people choices and improves their lives.
- ✓ The four pillars of human development are equality, sustainability, productivity and empowerment

HUMAN DEVELOPMENT INDEX

- The Human Development Report is an annual milestone publication by the Human Development Report office of the United Nations Development Programme (UNDP).
- The Report was first launched in 1990 by Mahbub-ul-Haq and Amartya Sen.
- Human development is measured in terms of life expectancy at birth, education and per capita income.
- Norway has highest HDI ranking.
