ATTITUDE

MODULE – 19

**ATTITUDE AND BEHAVIOUR;
MORAL ATTITUDE**

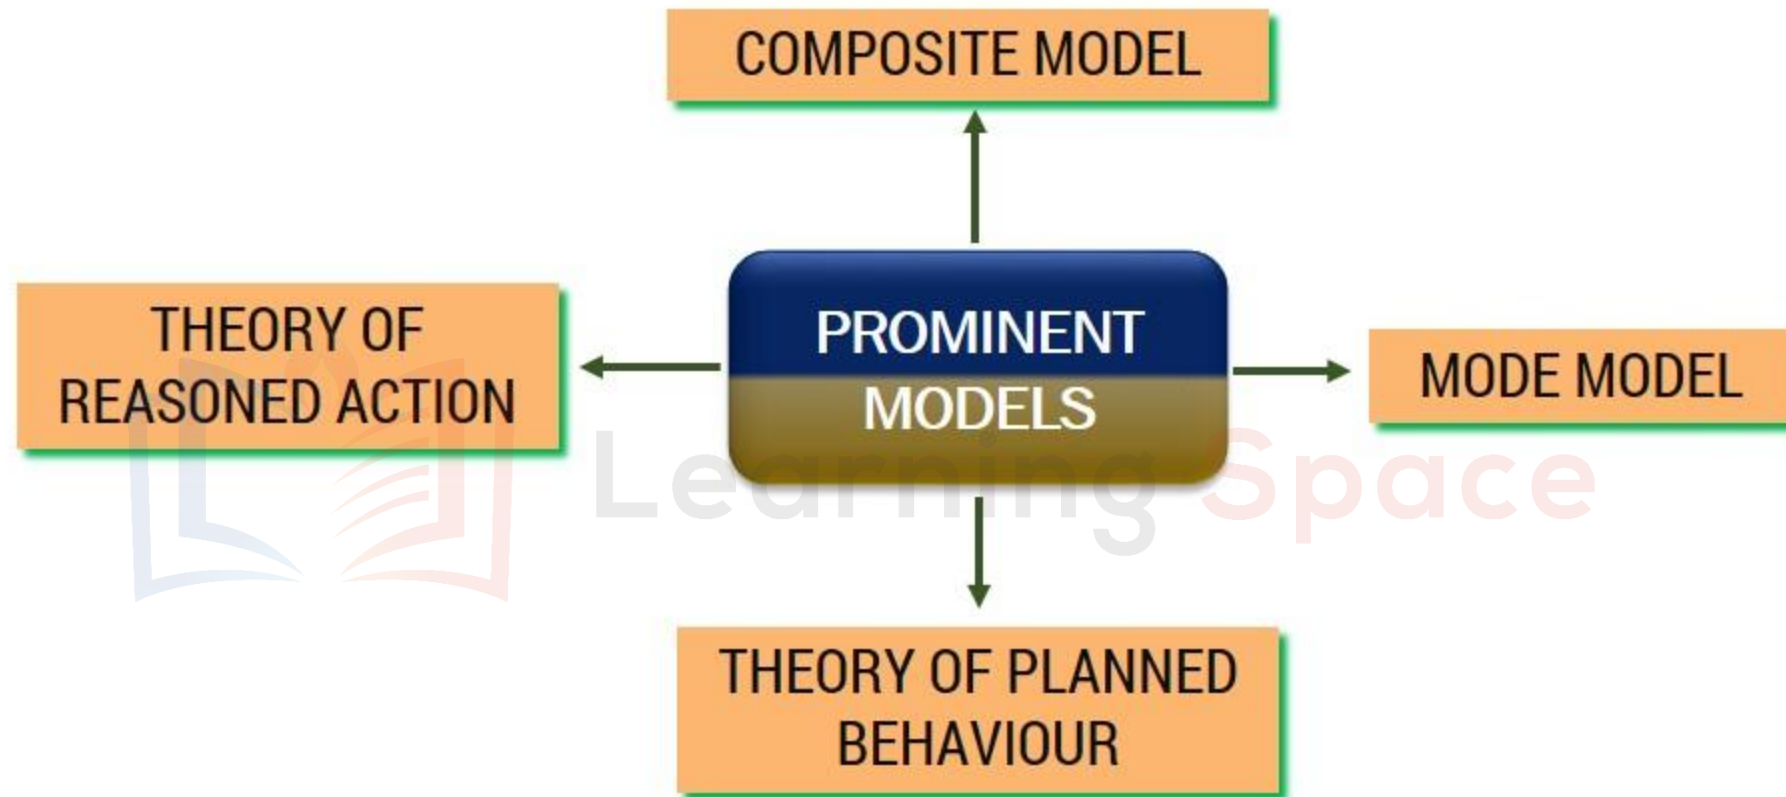

ETHICS, INTEGRITY & APTITUDE

BELIEFS TO BEHAVIOUR

ETHICS, INTEGRITY & APTITUDE

HOW ATTITUDES PREDICT BEHAVIOUR

The most prominent models: Fishbein and Azjen's theory of reasoned action as well as its extension (theory of planned behaviour), Fazio's MODE model and Eagly and Chaiken's composite model.

ETHICS, INTEGRITY & APTITUDE

HOW ATTITUDES PREDICT BEHAVIOUR

MARTIN FISHBEIN

ICEK AJZEN

Theory of reasoned action: a model in which behaviour is predicted by behavioural intentions, which are determined by attitudes and subjective norms.

Theory of reasoned action: a model in which behaviour is predicted by behavioural intentions, which are determined by attitudes and subjective norms.

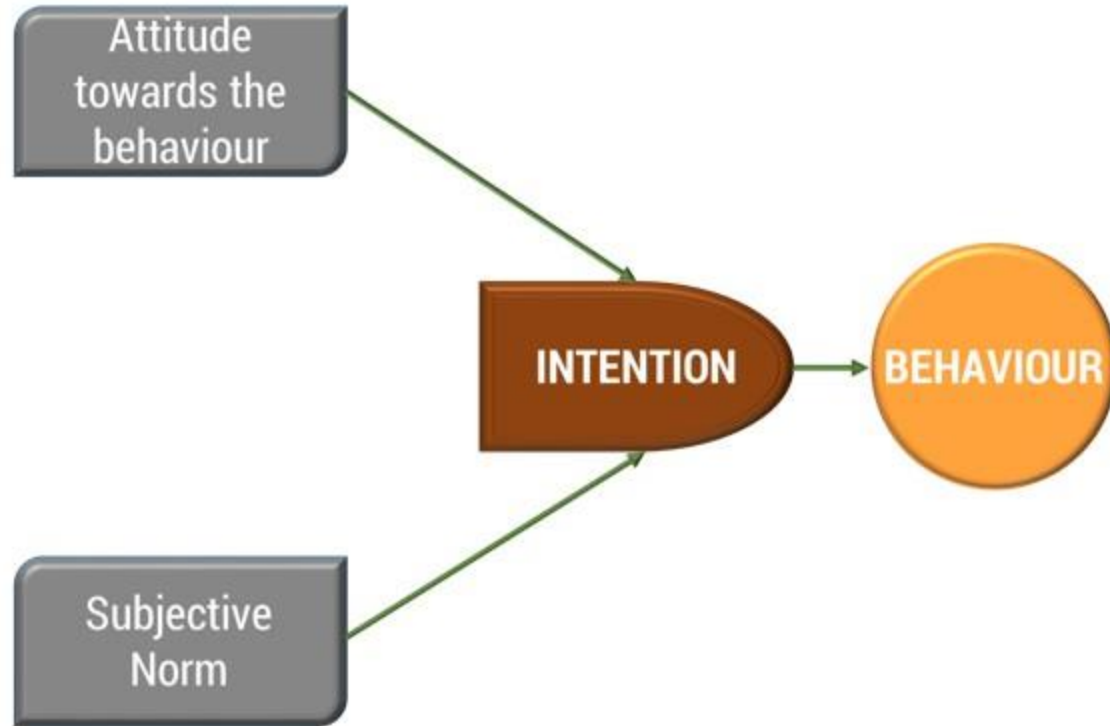

Theory of reasoned action was developed to predict deliberative or planned behaviour. According to this model, the immediate predictor (or determinant) of individuals' behaviour is their intention.

If you intend to recycle household waste, you are likely to engage in this behaviour.

As per this model, intentions are determined by: attitudes and subjective norms.

ETHICS, INTEGRITY & APTITUDE

HOW ATTITUDES PREDICT BEHAVIOUR

THEORY OF REASONED ACTION

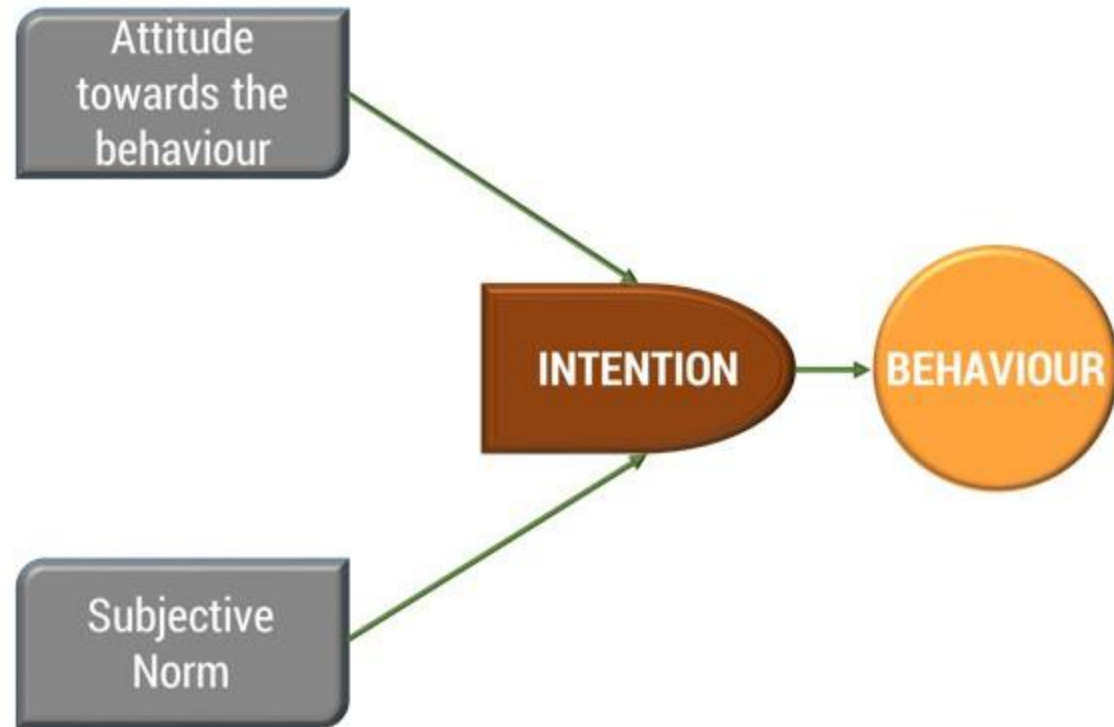

The **attitude component** refers to the individual's **attitude towards the behaviour** – **whether the person thinks that performing the behaviour is good or bad.**

A person's **attitude towards a behaviour (recycling waste)** is a function of the **expectancy that the behaviour will produce a desired consequence (helping the environment)** and the **value attached to this consequence (it is good to help the environment).**

An individual's **attitude is derived by multiplying the expectancy and value for each consequence and summing these values.**

ETHICS, INTEGRITY & APTITUDE

HOW ATTITUDES PREDICT BEHAVIOUR

THEORY OF REASONED ACTION

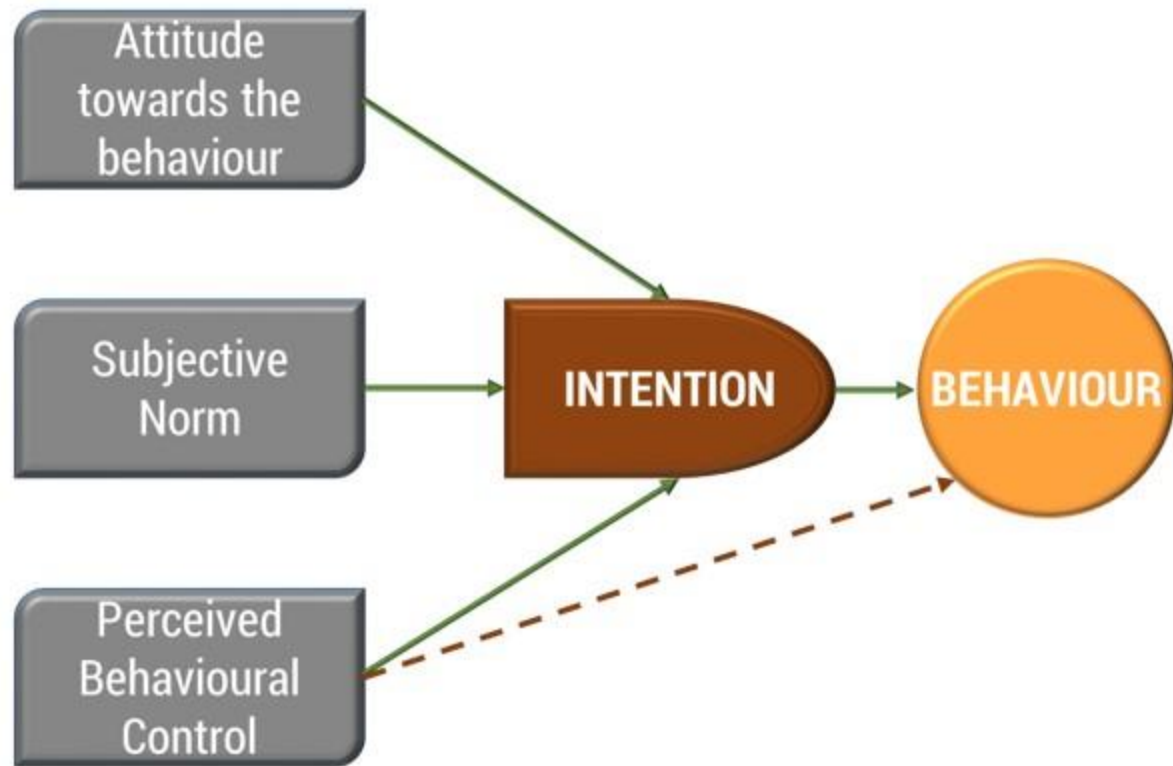

Subjective norms refer to an individual's beliefs about how significant others view the relevant behaviour.

The subjective norm component is a function of normative beliefs (how important others expect the individual to act) and the individual's motivation to comply with these expectations.

In the example of household waste, subjective norms will be high if your family and close friends have positive expectations towards recycling household waste and you are motivated to comply with these expectations.

ETHICS, INTEGRITY & APTITUDE

HOW ATTITUDES PREDICT BEHAVIOUR

THEORY OF PLANNED BEHAVIOUR

Theory of planned behaviour: it is an extension to the theory of reasoned action and includes the concept of perceived behavioural control.

Individuals' actions are also influenced by whether or not they felt they could perform the relevant behaviour.

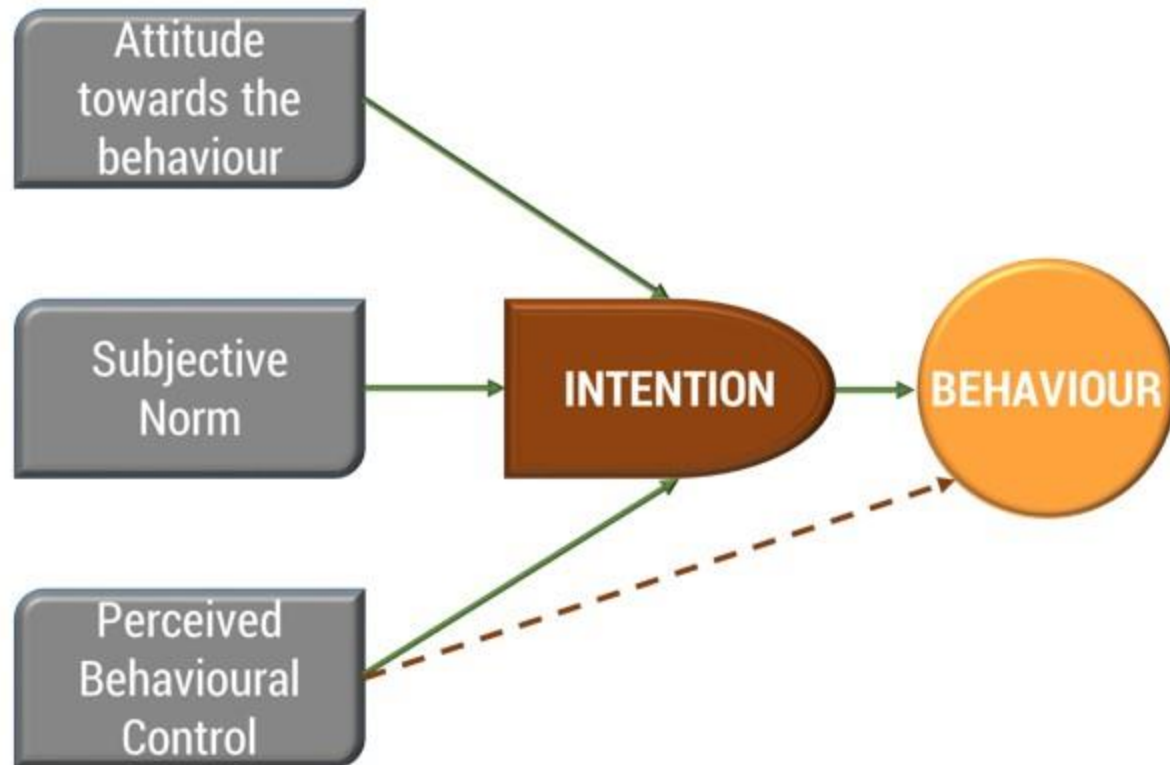

If an individual wanted to change his dietary habits by eating a healthier diet, a positive attitude and positive subjective norms are unlikely to produce the desired behaviour change if he is unable to restrain himself from eating sweets, chocolates and junk food.

The third element, perceived behavioural control, is determined by control beliefs – individuals' perceptions about whether they possess the resources and opportunities required to perform the behaviour.

ETHICS, INTEGRITY & APTITUDE

HOW ATTITUDES PREDICT BEHAVIOUR

Perceived behavioural control influences behaviour in two ways.

While individuals may believe that they can perform the relevant behaviour, their perception may not be accurate.

First, it is postulated to have a **direct causal influence on behavioural intentions**. This implies that an individual's intention to engage in a particular behaviour is affected by his or her perceived confidence in his/her ability to perform the action.

Second, perceived behavioural control also has a **direct effect on behaviour**. This relationship is dependent upon actual control of the relevant action, that is, whether the behaviour can, in reality, be performed.

Put simply, while individuals may believe that they can perform the relevant behaviour, their perception may not be accurate.

ETHICS, INTEGRITY & APTITUDE

HOW BEHAVIOURAL INTENTIONS TRANSLATE INTO BEHAVIOUR

A student might say to himself, 'when I return from Sankranti holidays, I will start revising for my upcoming examinations'.

IF

A

then

B

According to the concept of implementation intentions, **implementation intentions** are conceptualized as 'if-then' plans that specify a **behaviour** that one will **need to perform** in order to achieve a goal **and** the **context** in which the behaviour will occur.

Implementation intentions take the form of mindsets in which an individual attempts to specify where and when a behaviour will be enacted, in the form of 'When I encounter the situational context A, I will perform behaviour B'

Forming an **implementation intention** increases the **likelihood** that an individual will perform a desired behaviour.

Like the theories of reasoned action and planned behaviour, the composite model suggests a link between attitudes, intentions and behaviour.

EAGLY AND CHAIKEN

The model proposes a number of factors that affect attitudes towards behaviours:

- Habits (relevant past behaviour)
- Attitudes towards targets (the target of the behaviour)
- Utilitarian outcomes (rewards and punishments associated with performing the behaviour)
- Normative outcomes (approval and disapproval from others that might occur from performing the behaviour)
- Self-identity outcomes (how performing the behaviour might influence the self-concept).

Some of these factors can affect either intentions or behaviour directly.

MODE MODEL

When our behaviour is spontaneous, the theory of planned behaviour may not provide a proper conceptualization of behavioural prediction.

RUSSEL FAZIO

MODE refers to **Motivation and Opportunity** as **Determinants** of behaviour.

The **MODE** model suggests that, if individuals have both **sufficient motivation and opportunity**, they may base their behaviour on a **deliberative consideration** of the available information.

However, **when** either the motivation or the opportunity to make a reasoned decision is low, **only attitudes** that are **highly accessible** will **predict spontaneous behaviour**.

***MODE model:** a model of attitude–behaviour relations in which **motivation and opportunity** are necessary to make a deliberative consideration of available information.*

MORAL ATTITUDES

Moral Attitudes, which have their base in moral convictions, are attitudes of individuals towards moral issues.

As **attitude** is about what we like and **morals** are about (what society thinks as) right or wrong, moral attitude is **the attitude we hold towards moral issues** (where society debates what is right or wrong).

Our opinions towards capital punishment, social or religious segregation and euthanasia are examples of moral attitudes.

Not all attitudes are related to morality and the notion of morality may vary from person to person.

The crack down on Uighurs by China is condemned by many across the world, but the majority in China do not share that opinion and do not view it negatively.

Several factors such as family, education, religion and society influence our moral convictions.

Usually moral compulsions lead to strong attitudes, but at the same time not all strong attitudes are based on moral convictions.

Several factors such as family, education, religion and society influence our moral convictions.

While moral attitudes are normally subjective and reflect matters of choice, attitudes derived from preferences or conventional beliefs are usually normative.

The society and the world are facing a lot of moral issues today, and our evaluation of these issues and forming an attitude towards them is very important.

MORAL ATTITUDES

Some of the moral issues our society is facing are:

- | | |
|-------------------------|---------------------|
| ▪ Reproductive cloning | ▪ Consumerism |
| ▪ Surrogate motherhood | ▪ Divorce |
| ▪ Abortion | ▪ Honour killing |
| ▪ Gender discrimination | ▪ Gambling |
| ▪ Pornography | ▪ Alcoholism |
| ▪ Prostitution | ▪ Drugs |
| ▪ Dance bars | ▪ Cheating |
| ▪ Euthanasia | ▪ Rampant crime |
| ▪ Capital punishment | ▪ Dishonesty |
| ▪ Homosexuality | ▪ Violence |
| ▪ Live-in relationships | ▪ Religious freedom |

Moral values are concerned with interpersonal modes of conduct, and moral attitudes are derived from the moral values we hold. The moral values may change from person to person, society to society or time to time.

Examples of moral values: forgiveness, salvation, truthfulness, honesty, helpfulness, responsibility, goodness, respect, non-violence, altruism, tolerance and love.

Moral values, attitudes and behaviours are considered essential for coexistence and order and general wellbeing of the society.

Moral attitudes are normally linked with strong emotions and thus avert deviant social behaviours among normal societies due to the fear of social ostracisation by the society.

Attitudes from moral compulsion can be differentiated from other attitudes based on preferences or conventions.

Linking moral convictions to attitudes usually leads to **positive outcomes**. Some of them are:

The positive moral attitudes and the accompanying behavioral patterns may lead to a better and peaceful society, welfare of every individual and peaceful co-existence.

Moral attitudes encourage an individual towards realising moral values such as altruism, simplicity and social service.

They have a positive effect at both individual, family and societal level: make a person more tolerant and at peace with himself; help in sustaining families and familial relationships; build stronger nations; and shape the world in which we live.

Having strong moral attitudes doesn't always result in positive outcomes.

Strong moral attitudes may also lead to several **negative outcomes** such as:

Inability to generate procedural solutions to resolve an issue and instead rely on strong emotions resulting in violent behaviour (even terrorism).

Leads to non-compliance with decisions or policy outcomes irrespective of their legality and legitimacy.

Attitudinally different people may form separate groups and end up socially and physically distant from each other.

May lead to increased distrust of legitimate constitutional mechanisms, such as judicial system, to resolve an issue.
